This invention relates to an apparatus for the fabrication of tubular substructure for tubular substructures in metal-matrix composites for a rotor spinning mill which includes a tubular substructure shaping device located upstream of the billet forming device, a billet forming device and a billet shaping device, which are connected to one another in the direction of the transport of the emerging billets. The shaping device, in particular, includes a cutting device for shaping the emerging billets into a tubular substructure shape of the rotor spinning mill, This invention also relates to an apparatus for the fabrication of tubular substructure for tubular substructures in metal-matrix composites for a rotor spinning mill, which includes a shaping device located in the billet side flow at the outlet side of a billet forming device and a shaping device located in the metal-matrix flow of the outlet side of a billet forming device, where the shaping device includes at least one tool that is driven to rotate, which is adapted to the form of the emerging billets, and that is equipped with at least one shaping tool that is moveable in the axial direction of the billet, where the shaping tool can be moved toward a groove and can be withdrawn from the groove, and where the billet forming device is located on the exit side of the billet shaping device. Machines for the fabrication of tubular substructure for tubular substructures in metal-matrix composites for a rotor spinning mill are known. For example, DE 10 2004 034 879 A1, which is incorporated herein by reference in its entirety, discloses a method for manufacturing a tubular substructure for the production of shells for machines for spinning metal-matrix composite webs. The billet shaping device of this known machine makes it possible to shape the material in the circumferential direction and simultaneously to completely transform it into a tubular shape. To that end, the billet shaping device includes at least one shaping tool that can be moved in the axial direction and that is equipped with a plurality of shaped recesses, which act in a cutting manner,
